

Green Flag

7-24-4 FLS

Your Improved Green Flag Formulation!

You Can't **RESTART** A Corn Plant!

Get Your Corn Off To A Quick & Healthy Start With Green Flag 7-24-4 FLS!

NITROGEN— Essential for all amino acids, proteins, and for chlorophyll activity. Plants require more nitrogen than any other nutrient.

PHOSPHORUS—Phosphorus Is critical in early growth stages for root development, early plant growth, photosynthesis, respiration, and energy storage and transfer.

POTASSIUM— Mobile nutrient and affects all growth cycles. It encourages root growth, strengthens stalks, transports sugars and starches, assists in protein formation, and helps defend against plant diseases.

SULFUR—Sulfur encourages the plant to use nitrogen. It also aids in the stabilization of nitrogen to help keep it in the soil. Sulfur is also important for reducing stress of cold weather, defending against plant diseases, and assisting in protein formation.

ZINC— Promotes root development, Vigorous shoot growth, stress tolerance, and a more even maturity. It also improves the test weight of corn.

CALCIUM— Thickens the cell walls, translating to a disease resistance and stalk strengthening.

MAGNESIUM— Critical for all chlorophyll activity and is also essential for maximum enzyme reactivity and protein synthesis, which encourages maximum yield potential.

MANGANESE— Important for chlorophyll activity. Higher organic matter soils may indicate a potential need for manganese.

COPPER & IRON— Essential for photosynthesis and respiration of the plant. Iron is also important for stabilizing nitrogen metabolism. Copper is a natural fungicide.

"Phosphorus has a direct impact on maximum number of kernels per ear, which is determined by the corn's 5th leaf stage."
